Balancing Worksheet

Name _____

Balancing Chemical Equations Coefficients - tell you the number of atoms or molecules. An equation must be balanced - it must have the same number of each atom on both sides of the equation. To balance an equation, *you are only allowed to change the coefficients.*

Tips for Balancing Equations: (trial and error)

- If an element appears just once on each side of the equation, try balancing it first ("cross over" the coefficients)
- If the same polyatomic ion appears on both sides of the equation, treat it as a single unit.
- If an element appears by itself on one side of the equation, try balancing it last. (Use fraction if needed, then eliminate fraction.)
- A balanced equation must have the lowest possible whole number ratio of coefficients.

- Write a balanced equation for the following rxn:
Chlorine reacts with sodium bromide to produce bromine and sodium chloride.

- Write a balanced equation for the following rxn:
Sodium hydroxide reacts with aluminum chloride to produce aluminum hydroxide and sodium chloride.

- Write a balanced equation for the following rxn:
Potassium reacts with sulfur to produce potassium sulfide.
